Re: Full Stack Developer

Dear Hiring Team,

I am applying for the Full Stack Developer role. For more than five years I have worked on products where reliability and security matter: Java Spring Boot microservices and React front ends for payment and banking systems, delivered in Agile teams alongside clients, designers and QA.

At Innostax, I implemented the global payment flow for Bancstac, integrating VISA, Mastercard, Amex, UnionPay and JCB with 3DS authentication and PCI DSS compliance. The Spring Boot microservices behind it, built on RabbitMQ, MySQL, Elasticsearch and Redis, reduced payment-gateway latency by approximately 20%. For a Sri Lankan banking client, our services cut transaction processing time by 20% and operational costs by 18%.

Across the stack, I have built with React, Next.js, TypeScript and Node.js, and implemented OAuth, JWT and Okta-based authentication for Angular, React and Vue starter applications, backed by MongoDB, PostgreSQL and MySQL, with Docker, AWS and Jenkins for delivery. I now lead Tendable, a healthcare quality-inspection platform, coordinating a team of nine or more across web, mobile and QA. I review pull requests, prioritize work, manage staging deployments and keep the client informed.

I also stay hands-on with new technology. On QA Scanner, our AI-driven website analysis product, I built both the first monolithic version and its microservice successor, using Python, FastAPI, Playwright, Next.js and AI agents, with parallel multi-model analysis, an MCP server and Langfuse monitoring.

I would bring this mix of full stack delivery, API and microservice design, and disciplined review and release practice to your team. My habits of documenting decisions, reviewing code carefully and working in Agile sprints, from planning through release, would let me contribute quickly. I would welcome the chance to discuss the role.

Sincerely,

Aakash Siwach
